Annotation

All countries have their own educational system and their system is effective for themselves. It can be distance education or traditional education however their teaching way cannot be appropriate for other countries' nationality.

Key words: positive and negative sides, Distance education, flexibility, traditional education, self-development.

In a developing world, changes are effecting to education system as well, because of this, lessons are separated to traditional or distance education and both have positive and negative sides.

Distance education

Firstly, online studying gives more opportunities for students like flexibility. This advantage avoids students from wasting their time. This means that for going to school or university also takes much time. Instead of set aside time for such actions, students may study other subjects as well. It improves students' selfdevelopment. The next flexibility is, it does not demand particular place for learning. Students can attend the lessons where they want to be. That place may be among the nature or library. It helps students for keeping concentration in only studying. Some students live far from their home and they need to find accommodation. By the way, they may have many difficulties related to its price. However in distance education, they do not meet such problems.

Online learning can also prove essential to many adults. Some people never finish high school and want to get an actual diploma without having to step back into the

classroom because they work full-time. Online learning offers a variety of options. No matter what students study, they can find the courses or programs they need online (from a career certificate to a doctorate).

However, distance education demands high quality of internet and technics. If their quality become low, it creates misunderstandings of students.

Traditional education

On the other hand, traditional education refers to the type of instruction that takes place in a classroom where both instructor and students are physically present. This traditional classroom-based setting requires students to attend classes in person and on campus of traditional educational institutions. It mostly appeals to learners who prefer face-to-face interaction or want to live the real college experience. Counselors and professors are available for additional assistance and guidance on campus. In a traditional classroom, hands-on training during class can take place (e.g., in a laboratory) and students interact with fellow students directly while getting involved in many hands-on projects. Depending on the class schedule, students attend two or three classes per week, either during the day or in the evenings.

In a traditional education giving guidelines is easy for teachers according to their strength and weakness, because teachers must teach all students, however all students are not equal and their strength of learning subjects is not the same, so developed countries use offline lessons for rising students' knowledge. I also believe that traditional education is more effective.
