Abstract. This thesis gives information about how use integrated technologies in the classroom. There will be given some ways to do this. It is done by gaming, website, blog, social media, planning. All these methods will be explained by details. Why we need this kind of thing? What are the benefits? Are there any disadvantages? How can we use these technologies? All this questions will be answered and any one can easily get information and do this with themselves. In a sentence, all things will be about how we can use integrated technologies in the study.

Keywords: blog, social media, integrated technologies, multidimensional, gadget, smart board, website.

Time is going on and new problems are found. So can we solve them? If we can, how can we solve? Yes. By integrating technology into the classroom.

"Technology helps change the student/teacher roles and relationships: students take responsibility for their learning outcomes, while teachers become guides and facilitators,"Edutopoia mentioned. "Technology lends itself as the multidimensional tool that assists that process". This is true. It can affect and assist to the process of education. But there is also another side. This may be challenging. It is needed the expensive sources like smart board, computer or laptop, gadgets. Not everyone can not have enough finance for this. Disability leads to failure. Anyway, having modern technologies is not impossible work with trying and wanting.

1. Using this technology with game.

Modern students are fed up with learning subjects with old methods. They are interested in unusual and not boring things. It means most of them are crazy about games. Teachers can get their notice with using games in study. For example, making a game which consist of facts. This game help to improve creating, thinking and memory. Making a competition is also effective way to improve students and for using technologies. Because students compete with each other and they try to use their all opportunities to win. There is not access to Wikipedia. Because students may cheat and may affect in a bad way. There are about 880 million students in the world. There is given a table which are percentages of people who have technologies:

Places	Number	Percentage	People who don't have access to technologies
Large cities	840 million	78 percent	22 percent
National public	Approximately 854 million	81 percent	19 percent
Most parts of Africa	About 198 million	More than 30 percent	About 70 percent

2. Planning.

Without not knowing using technologies it is magic to use technologies into student use . First, teacher should explain how to use technologies. It is very difficult to know how to use technologies without getting teaching. Because students may face problems and may give up. That is why teaching and explaining are important. Everything should have discipline. It may go wrong without discipline. About 65 percent of works face failure without planning. That is why plan and discipline are essential in the process.

3. Blog

Students usually have problems without teacher or they do not remember the question which they decided to give teacher before lesson. That is why teachers should have blogs. After that they can notice how their blogs become more effective. Students give their questions to teacher easily and they do not waste time. It also helps to work with each student. Their learners are able to read all, to do it(tasks) , and also share their knowledge and emotions with their parents . Because it is very good but also this may effect if this is done at home.

4. Creating web site.

There are a lot of fun ways to integrate technology into the classroom, but there is no such interesting and enjoyable things like web site. Modern children are like part of the net. Because they spend more half of their time to surfing the net. That is why it is not very boring if study will be with website

It has been possible also for educators, since WordPress makers make this free and functions and themes that students and their educators use are developing. This may be one of the factor to hold students focus on the study. Because the main goal of making websites is to staying focus on the study from very beginning till the the end of the course.

Also learning or teaching with the help of websites may give the limitless chances. The cause of this is learners' health problems. Not all students can go to the school and participate to the lesson. There are some pupils who are unable. And this method may choice to study well. Because the only thing that pupil must have is access to the internet.

They can easily participate and do the following tasks.

5. Telegram, Whats App, Twitter, Facebook or in a word social media.

The next thing that today's learners most used is social media. Because they just forget their life when they are watching the videos or just use this. And this may make worse their attention and interest to the learning. The reason of this is videos are easier and more interesting to watch. To improve this teachers should make video of lessons and topics and put it on YouTube or Facebook. This will be easy to find it. Or making online discussions via Zoom. Because discussion is one the key to successful study.

But teacher make the rules to the students when they use social media. For example, they should be under parents attention. Because it is very easy to be interrupted. Even with advertisement. They may go to another channels or playing games. That is why they should be very honest and be under control of their mothers and fathers. But most of parents think this unimportant and they also spend their hours to the unnecessary channels and become very angry because of bad study of their children. Because children is like mirror, parents see their themselves when they see their children. Because children do the things which their relatives did.
