**ORGANIZING SYSTEM OF DISTANCE EDUCATION IN PRIMARY SCHOOLS
AND HIGHER EDUCATION SYSTEM**

B. Kobilova

Abstract: This article discusses the benefits and drawbacks of distance learning in primary school and higher education. The focus is on distance learning to address today's social issues. At present, in accordance with the Law of the Republic of Uzbekistan "On Education", the education system is based on the reform of the education system, the formation of a competitive environment in state and non-state educational institutions and training, as a set of output. The current distance learning system is one of the newest and most convenient forms of teaching, which allows students to teach at a convenient time, place and environment, but in this way the specialist. It also raises new and pressing issues for the anticipators

Keywords: Distance learning, educational news, education system, problems in education, 5-day education system, pedagogical technologies.

The current distance learning system is one of the newest and most convenient forms of teaching, which allows students to teach at a convenient time, place and environment, but in this way the specialist. It also raises new and pressing issues for the anticipators

At the same time, they will be able to improve their skills with the help of news. Although distance learning is designed for geographically diverse educational institutions, the development of modern technologies allows for the long-distance implementation of the educational process.

However, distance learning has its advantages and disadvantages, as it helps students to work on themselves, while direct live communication between teacher and student is limited.

Therefore, it is necessary to further reform the education system and conduct research to develop highly qualified personnel in line with the education system of developed countries [1].

The field of distance education is one of the most advanced projects not only in Uzbekistan but also in all regions of Central Asia. It is no exaggeration to say that we have encountered a number of problems in our online education system. If we put this into practice more, we will be able to develop skills and competencies in students and use this system effectively. Distance learning includes primary, secondary, tertiary and advanced training.

Therefore, it is possible to establish a system of distance education in the primary school with the effective use of information technology.

This is confirmed by the opinion of our President Shavkat Mirziyoyev on youth. "Another important issue that has always been on our minds is the morals, behavior and, in short, the worldview of our youth. Times are changing fast today.

It's the young people who are most affected by these changes. "So there is no home without the Internet today, so set up this system to have a positive impact on their minds. It is up to us and you to find ways to further reform our education system.

The need to introduce and master modern pedagogical technologies has been repeatedly mentioned in the National Training Program, and the need to bring them to educational institutions, but due to the fact that we do not use them in practice, this year, for some reason, It is no exaggeration to say that our transition to the education system has led to a number of problems [2].

Not only the primary education but also the higher education system did not meet the demand enough.

In China, for example, in Japan, Korea and Singapore, the primary education system lasts for 6 years. In Russia, the primary education system is similar to ours, with grades 1-4 receiving 5-9 basic and 10-11 grades receiving full secondary education.

There have been many changes in our education system as well. We used to have a 9-year compulsory education system, but now we have an 11-year education system.

In particular, at the meeting of the Cabinet of Ministers of the Republic of Uzbekistan No. 11 of February 9, 2018, changes were introduced and the transition to a 5-day training process in our primary education system was

discussed between parents and the general public. We are aware that the work has been done.

Therefore, by introducing innovations in the primary education system and making effective use of their time, we would be able to use their time 6 days a week, and we would be able to achieve better results in higher education in the future. we would be able to deliver lessons not covered in direct reading in a 5-day lesson system by developing students 'ability to listen and remember.

However, given that students are tired and bored quickly due to the high pressure in the 5-day course, we can not only make the lesson more interesting, but also strengthen the lessons taught during the week through television lessons.

In the primary education system, this year's 1st graders may have some difficulty transitioning to the next grade due to their inability to fully adapt to this system.

This is one of the most pressing issues in primary education today. We are required to find a solution to this problem and adapt education and upbringing to the needs of the times. It is well known that the educational process plays a special role in the development of young people as individuals.

In the education system, we need to pay attention to the preparation of preschool children for school, to get rid of the stereotypes of the teaching process, to teach some subjects and subjects in depth, and to educate them in the spirit of confidence in their abilities. 'l plays. the family also plays a leading role.

Due to the great need for computer science today, the improvement of this subject from the 5th grade this year will be a solution to the problems associated with our distance education, as well as the process of creating and mastering innovations in our education system in the XI century technology. It allows us to find solutions to problems.

Previously, 10 million students studied in the distance education system, worked on their own, but this year, even in the secondary special education system, this education has not been effective. we can see.

In conclusion, the quality of distance learning not only increases the quality of learning and productivity, but also allows us to take another step into the future.

Abstract: *Nowadays, in the world of information, the era of the Internet, the rapid development of multi-media information technology such as Internet TV, Internet radio, email, online video, and their audience and influence are expanding. There is no need to talk too much. Such information the tools of the young people with a great deal of interest, and from them. It is, which is widely used, is really it is difficult to understand the importance of the matter.*

Keywords: internet, dating sites, technology, Information and communication technologies (ICT).

Today, Internet users are conditionally divided into two categories can be separated. The first category is based on the demand of the profession or for the purpose of obtaining information and information necessary for scientific research, while those who turn to the internet, the second category is just as interested in, say, dirt, sunbathing dating sites or playing online games. He manipulates the virtual world. Manipulation and intellectual dependence by submitting to him. It is no secret that now some children or teenagers are turning their Internet cafe into a second home. Observations show that online game players are predominantly also adolescents. The physiological and social development of adolescence is a typical period. If boys or girls during this period aggressive roller coaster online games, with unpleasant consequences is likely to come. Understanding human time in the virtual world. The system is disrupted and social activity is reduced. Time in front of the computer. Here's the reason for not feeling past. Consequently, today Internet. It combines the capabilities of all sectors.

Information and communication technologies (ICT) in the first place, The Internet is a factor that directly influences the upbringing of children and adolescents. At the moment 5 million young people in our country the user has their profile on social networks. Of these, 3.6 millions use their mobile phones for access. According to experts, information technology has become such an integral part of the society that it is no longer a technological
